Best-first search

3

Local search

# Heuristics

## UNINFORMED VS. INFORMED

Uninformed

Can only generate  
successors and distinguish  
goals from non-goals

Informed

Strategies that know whether  
one non-goal is more  
promising than another

# Note

Image credit: <https://www.101computing.net/a-star-search-algorithm/>

# Heuristics

- ❖ Extra **information** used by the searching algorithm beside problem definition
- ❖ Heuristic is an **estimated** cost to goal node
- ❖ **Recall**, heuristic is not actual cost it is just an expectation ( **optimistic** )

# Heuristics

$g(s)$ : this is a function that measures the “cost” it incurred from the initial node  $s_0$  to the current node  $s$ .

$h(s)$ : this is a function (or “budget”) that estimates the forth-coming cost from  $s$  to a goal node  $s_g$ .

$h(s)$  is called a **heuristic function**.

# Heuristics, example

## Route finding problems:

❖  $h(n)$  = straight line distance (SLD) from node to goal

# Heuristics, example

## The 8-puzzle:

$h(n)$  = number of misplaced tiles

7	2	4
5		6
8	3	1

Start State

	1	2
3	4	5
6	7	8

Goal State

$$h(\text{node}) = 8$$

# Heuristics, example

## The 8-puzzle:

**$h(n)$  = total Manhattan distance (i.e., no. of squares from desired location of each tile)**

7	2	4
5		6
8	3	1

Start State

	1	2
3	4	5
6	7	8

Goal State

$$h(\text{node}) = 3+1+2+2+2+3+3+2 = 18$$

# Heuristics, example

## The 8-queens:

**$h(n)$**  = number of pairs of queens that are attacking each other, either directly or indirectly

$h(\text{node}) = 17$

# Informed search algorithms

- ❖ Use the heuristic function in order to optimize the search
- ❖ Informed search algorithms:
  1. Best-first search
    - 1.1 Greedy search
    - 1.2 A\* search
  2. Local search
    - 2.1 Hill climbing algorithm
    - 2.2 Genetic algorithm

# Best first search

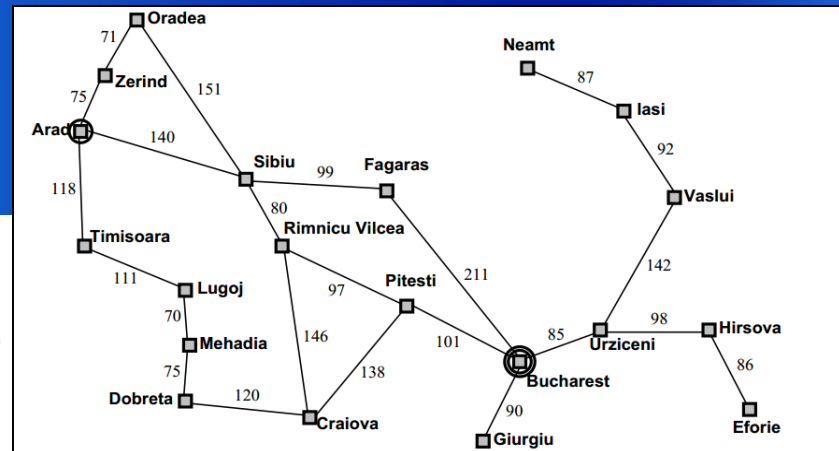

## 1. Greedy search

- ❖ Evaluation function  $f(n) = h(n)$
- ❖  $h(n)$  is the heuristic function
- ❖ Greedy best-first search expands the node that appears to be closest to goal

choose node with minimum  $f(n)$

# Best first search

Total cost =  $140 + 99 + 211 = 450$   
Is this the optimum solution ?

# Evaluation

## 1. Greedy search

### ❖ Complete?

- Suppose we start in **Iasi** and the goal is **Fagaras**
- Greedy select **Neamt** for expand because it is closest to **Fagaras**
- But it is dead end, it only generate **Iasi** again
- It will stuck in the loop: **Iasi** → **Neamt** → **Iasi** → **Neamt**,.....

# Evaluation

## 1. Greedy search

- ❖ **Complete?** No (can stuck on loops)
- ❖ **Time?** Exponential (good heuristic can give dramatic improvement)
- ❖ **Space?** keeps all nodes in memory (**look at this**)
- ❖ **Optimal?** No

# Best first search

## 2. A\* search

- ❖ Avoid expanding paths that are already expensive
- ❖ Evaluation function  $f(n) = g(n) + h(n)$ 
  - $g(n)$  = cost so far to reach  $n$  ( actual )
  - $h(n)$  = expected cost from  $n$  to goal ( **estimated** )

# Best first search

## 2. A\*search, example

Total cost = 418

Is this the optimum solution ? yes

# Evaluation

## 2. A\* search

- ❖ Complete?                      yes
- ❖ Time?                          Exponential
- ❖ Space?                      keeps all nodes in memory (look at this)
- ❖ Optimal?                      yes

# Evaluation

- ❖ Heuristic function should be **admissible** in order to find optimum solutions
- ❖ A heuristic  $h(n)$  is admissible if for every node  $n$ ,  $h(n) \leq h^*(n)$ , where  $h^*(n)$  is the true (**actual**) cost to reach the goal state from  $n$
- ❖ An admissible heuristic **never overestimates** the cost to reach the goal, i.e., it is **optimistic**

# Evaluation

## Dominance

7	2	4
5		6
8	3	1

Start State

	1	2
3	4	5
6	7	8

Goal State

- ❖  $h1$  = the number of misplaced tiles = **8**
- ❖  $h2$  = manhattan distance = **18**

iff  $h2(n) \geq h1(n)$  for all  $n$   
then  $h2$  **dominates**  $h1$ ,

(both admissible)

- ❖  $h2$  is better for search than  $h1$
-

# Evaluation

## Dominance

The following table gives the search cost of  $A^*$  with the two heuristics, averaged over random 8-puzzles, for various solution lengths

Length	$A^*(h_1)$	$A^*(h_2)$
16	1301	211
18	3056	363
20	7276	676
22	18094	1219
24	39135	1641

Thank You !
